                 The present sequence is that of 1-aminocyclopropane-1-carboxylic acid synthase (ACC synthase) of mung bean. ACC synthase expression is induced in response to mechanical strain, auxin and salt stress. The invention relates to the promoter, pGEL-1 (see AAZ94266), of the ACC synthase gene, AIM-1. pGEL-1 is capable of induction by the induction by hysical and/or environmental stimuli in cells in which it is indigenous and, in the absence of any negative regulatory mechanism, is capable of constitutive expression in cells in which it is non-indigenous. The promoter can be used to direct expression of sense conferring useful traits on plants, such as improved resistance to a plant pathogen, altered nutritional characteristics, expression of a plantabody, altered blochemical pathway, altered flower colour.

This protein is a 1-aminocyclopropane-1-carboxylic acid (ACC) synthase encoded by a cDNA clone isolated from poplar trees which had been exposed to ozone. Exposure conditions were: 0.1 ppm ozone for 6 hours after one hour accilmation at 25 degrees C, 70 % relative humidity, 30 k lux and air current 30 cm/second. The gene will be useful for breeding air pollutant ozone-resistant trees, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      248

                                                                                                                                                                                                                                                                                                                                                               synthase (ACC synthase) of geranium cv. Sincerity was deduced from isolated CDNA clone pHSacc49 (see AAV30326). This ACC synthase has a mol.wt. of 55.1 kpa and is dealgnated as a Group II enzyme, 2 Group I geranium ACC synthases (see AAV80233 and AAW80234) are also claimed. The invention relates to new isolated ACC synthase genes from geranium and rose (see AAV80324.25 and AAV3030) and the use of antisense fragments of these genes to control expression of ACC synthase genes in transgenic plants, especially in geranium, rose and woody plants. By reducing the amount of ACC synthase produced in plant cells, the rate of ACC conversion to ethylene can be decreased. This can be used to prolong the shelf-life of cut flowers and to reduce leaf yellowing and petal abscission during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       128

This is a papaya 1-aminocyclopropane-1-carboxylic acid synthase (ACC synthase). The encoding nucleotide sequences are useful for the recombinant production and control of ACC synthase in transformed plants and cells, especially to control fruit ripening. The enzyme converts responsible for the ripening of fruit (ACC is converted to ethylene by CC oxidase). Commercial tropical fruit markets e.g. papaya production, require fruits in an adequately ripened state. Ripening is dependant on various conditions such as temperature and time. By providing ACC synthase conditions such as temperature and time. By providing ACC synthase conditions, the endogenous enzyme can be inhibited using antisense constructs, until it reaches its destination, then allowed to ripen, or be used in recombinant cells which can produce ethylene and in cripen fruit. Control or inhibition of ethylene production with nucleic acids is safer than chemical means, which can be toxic, and cannot be used for commercial inhibition.
                                                                                                                                                                                                                                                                               IALORIRNEVICONKEVVV -- SNKKHCWHSNL-RLSLKTRRFDDIT---MSPHSPLPQSPM 479

synthase, LE-ACC 1B. ACC synthase are capable of catalysing the conversion of AdoMct (S-adenosyl methionine) to ACC and methyl thioadenosine (MTA). ACC DNA is useful for producing ACC synthase which is essential for the production of ethylene in higher plants, where ethylene is a determinant of fruit ripening. The ACC DNA is also useful for producing transgenic plants which are overproducers of or are deficient in ACC synthase.
                                                                                                                                                                                                                                                                                                71 PEASICTPEGINDFRAIANFQDYHGLAEFRNAVAKFMARTRGNRITFDPDRIVMSGGATG 130

                                                                                                                                                                                                                                                                                                                                                                         3,
                                                                                                                                                            1-aminocyclopropane-1-carboxylic acid (ACC) synthase is essential for the production of ethylene in higher plants; ethylene is a determinant of fruit ripening. The present invention relates to an expression cassette which comprises the reverse transcript of RNA complementary to an RNA transcribed from ACC synthase gene. The expression cassette can be seed to prevent ACC gene expression. The expression cassette can be for inhibiting ethylene production and fruit ripening, when introduced into a plant or plant cells. The present sequence is the protein encoded by tomato ACC synthase gene LE-ACCIB(b) clone. This sequence was used in a sequence homology comparison with other ACC synthase gene clones
                                                                               Expression cassette for producing transgenic plants exhibiting inhibited ethylane production and delayed fruit ripening, comprises complementary RNA which inhibits 1-aminocyclopropane-1-carboxylic acid synthase synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                         133 ahemlafcladpgdaflyptpyypgfdrdlrwrtgyqlfpyycescndfkyttkaleeay 192

1-mainocyclopropane-1-carboxylic angular, control ethylene blosynthesis in coffee plants, as AcC synthase is an element of the ethylene coffee plants as AcC synthase is an element of the ethylene blosynthesis in blosynthesis pathway. Transformation of wild-type coffee plants with constructs containing the cDNA in an antisense orientation can block AcC synthase synthesis. The cDNA can also be used to block AcC synthase synthesis by co-suppression. Plants transformed with the cDNA are incapable of synthesising ethylene, which is necessary in the final stages of fruit ripening in coffee, therefore ethylene application enables fruit ripening to be controlled, e.g. application to the entire plant can synchronise ripening. Coffee beans are preferably obtained from mature fruit, but non-uniform ripening has necessitated laborious hand-picking, or low yields and productivity when harvesting by strip harvesting or mechanical techniques. The ability to synchronise ripening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     67 ILNNPEASICTPEGINDFRAIANFQDYHGLAEFRNAVAKFMARTRGNRITFDPDRIVMSG 126

(Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent web site at www.derwent.com/dwpi/updates/ntis_us.html.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genomic clone LE-ACCIA was one of four different clones identified in a library prepared from total DNA extracted from etiolated Rutgers seedlings. Screening was by the cDNA clone ptACCI (see AAQ15134). The amino acid sequence was deduced from the cDNA and shows constderable homology with ACC sequences deduced from the tromato and the zucchini clones.

This protein is a 1-aminocyclopropane-1-carboxylic acid (ACC) synthase encoded by a cDNA clone isolated from poplar trees which had been exposed to ozone. Exposure conditions were: 0.1 ppm ozone for 6 hours after one hour acclimation at 25 degrees C, 70 % relative humidity, 30 k lux and air current 30 cm/second. The gene will be useful for breeding air pollutant ozone-resistant trees, especially poplar.
                                                                                                     250
                                                                                                                              252

ъ,
                                           The present sequence is tomato 1-aminocyclopropane-1-carboxylic acid synthase, LE-ACC 1A. ACC synthase are capable of catalysing the conversion of AdoMet (S-adenosyl methionine) to ACC and methyl thioadenosine (MTA). ACC DNA is useful for producing ACC synthase which is essential for the production of ethylene in higher plants, where farthylene is a determinant of fruit ripening. The ACC DNA is also useful for producing transgenic plants which are overproducers of or are deflicient in ACC synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                430

                                                                                                                                                                                                                                                                                                                                                                                      Š.
                                                                                                                                                                                            1-aminocyclopropane-1-carboxylic acid (ACC) synthase is essential for the production of ethylene in higher plants; ethylene is a determinant of frult ripening. The present invention relates to an expression cassette which comprises the reverse transcript of RNA complementary to an RNA transcribed from ACC synthase gene. The expression cassette can be used to prevent ACC gene expression. The expression cassette is useful for inhibiting ethylene production and frult ripening, when introduced into a plant or plant cells. The present sequence is the protein encoded by tomato ACC synthase gene LE-ACCIA(b) clone. This sequence was used in a sequence homology comparison with other ACC synthase gene clones

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding anti-sense RNA blocking plant ACC synthase expression is used for producing transgenic plants with delayed fruit ripening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is tomato

1-aminocyclopropane-1-carboxylic acid (ACC) synthase LE-ACC2.

1-aminocyclopropane-1-carboxylic acid (ACC) synthase LE-ACC2.

1-E-ACC2 was used in the isolation of conserved sequences from five tomato (LE-ACC 1A, LE-ACC 1B, LE-ACC3, LE-ACC3 and LE-ACC4) and two zucchini (CP-ACC 1A and CP-ACC 1B) ACC synthases.

A novel DNA molecule comprises an expression system which, when contained in a plant host cell, generates RNA that is sufficiently complementary to an RNA transcript of an endogenous ACC synthase gene to prevent its synthesis. The expression system consists of the reverse transcript of the antisense RNA (i.e. CDNA) operably

The present sequence is tomato 1-aminocyclopropane-1-carboxylic acid synthase, present sequence is tomato 1-aminocyclopropane-1-carboxylic acid synthase, product of AdoMet (S-adenosyl methionine) to ACC and methyl thioadenosine (MTA). ACC DNA is useful for productine ACC synthase which is essential for the production of ethylene in higher plants, where ethylene is a determinant of fruit ripening. The ACC DNA is also useful for producing transgenic plants which are overproducers of or are deficient in ACC synthase.
                                                                                                                                                                                                                                                       Novel isolated DNA molecule encoding 1-aminocyclopropane-1-carboxylic acid synthase, LE-ACC2 useful for producing ACC synthase which is essential for the production of ethylene in higher plants -

Plant Physiol. 100:1615-1616(1992).
-!- FUNCTION: CATALYZES THE FORMATION OF 1-AMINOCYCLOPROPANE-1-CARBOXYLATE, A DIRECT PRECURSON OF ETHYLENE IN HIGHER PLANTS.
-!- CATALYTIC ACTIVITY: S-adenosyl.L.methionine = 1-aminocyclopropane-1-carboxylate + methylthioadenosine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        6

CARBOXYLATE, A DIRECT PRECURSOR OF ETHYLENE IN HIGHER PLANTS.
--- CATALYTIC ACTIVITY: S-adenosyl-L-methionine " 1-
aminocyclopropane-1-carboxylate + methylthioadenosine.
---- COFACTOR: PYRIDOXAL PHOSPHATE.
---- PATHWAY: FIRST, AND RATE LIMITING STEP OF ETHYLENE BIOSYNTHESIS.
---- SUBUNIT: HOMODIMER (BY similarity).
---- SIMILARITY: BELONGS TO CLASS-I OF PYRIDOXAL-PHOSPHATE-DEPENDENT
AMINOTRANSFERASES.

"Molecular cloning of an 1-aminocyclopropane-1-carboxylate synthase from senescing carnation flower petals.";

Plant Mol. Biol. 18:377-386(1992).

-!- FUNCTION: CATALYZES THE FORMATION OF 1-AMINOCYCLOPROPANE-1-CARBOXYLATE, A DIRECT PRECURSOR OF ETHYLENE IN HIGHER PLANTS.

-!- CATALYTIC ACTIVITY: S-adenosyl.L.methylthioadenosine.

-!- COFACTOR: PYREDOXAL PHOSPHATE.

-!- PATHWAY: FIRST, AND RATE LIMITING STEP OF ETHYLENE BIOSYNTHESIS.

-!- SUBUNIT: HOMODIMER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SIMILARITY: BELONGS TO CLASS-I OF PYRIDOXAL-PHOSPHATE-DEPENDENT AMINOTRANSFERASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HSSP, P37821, 188G.
